Preface

Out of 8.1 billion people on this planet, only around 5% have awoken to the true nature of life. Most still live in the first level of consciousness, fully immersed in the character they play and believed that life happens to them.

Humanity have never been as divided as it is today. Many are lost in their minds, searching for meaning and trying to fill a void they can't quite name. The rise in mental health struggles and suicide cases shows how far we have lost touch with the infinite intelligence within all of us. For centuries, we have been kept small and fearful, vibrating at lower frequencies. Those who first awakened to the control we are under often turned their indignation against these oppressors, unaware that this is the way the world is set up. It is our own unawareness that allows media and conditioned

knowledge to take control. External enemies can be easily conquered when there is no enemy within. The game of life is as such.

When you are ready, the light to the truth of humanity comes to you, helping you disconnect from the mind of helplessness and scarcity, and see yourself and the world more clearly.

You are meant to learn this knowledge that I am about to share with you. In fact, deep inside you've always known, you just need to remember. You're one of the few that can play an important part in this new earth. You may not notice it, but your influence reaches farther than you can imagine. Your light is what lifts every being around you. And that light ripple outward, creating butterfly effects.

The 7 Truths

11 years ago, I started actively exploring deeper knowledge of life. I find myself asking questions like "Why am I here?", "What's the purpose of life?", "What happens after death?" so often since I was a kid. I still have a vivid memory of myself at 9 years old, standing by my bedroom window, watching the rain drizzle. There is something about looking into the rain, it makes your mind wander.

As I look at the bigger houses up the hill, I started to think, "Why am I in this body? I have a good family, but why

this particular human I reside in? What if, what if I exchange soul with a girl in one of those big houses, what kind of a different life will I have? Will I be happier? Feel more special about myself?" And I remember, as a soul, I travelled out of my house, flew past the streets, above rows of houses, and arrived in one of the big houses. I was there in their living room, looking at the girl whom I consider exchanging my physical body with. Looking at her interacting with her parents, in a living room thrice as big as mine, wearing neatly tucked blouse and a pleated skirt, I thought, "That could be nice, but...I would rather be myself."

Once that thought appears, I immediately snapped out of my vision and found myself returned to where I was: standing beside the window in my bedroom. That was my first awakening.

It has been 20 years, yet that memory remains vivid, as if it happened yesterday. I had questioned myself and this character I play in this lifetime so deeply that it sparked a realization, that I am more than this body and reality has more layers than what we can perceive. For the first time, my consciousness shifted from point of view to bird's-eye view, and the illusion broke.

The relationship between science and spirituality particularly fascinates me, perhaps because I have always been a rational thinker who loves science and maths. I enjoy fitting the puzzle together and reaching a full picture where every piece makes sense and nothing contradicts. The

deeper I went, the more I realize that spirituality isn't the opposite of science; it is science, just at a level our technology hasn't evolved to measure yet. Spirituality is simply advanced science... we are living in a timeline where science is still premature, but it is slowly catching up. Science explains what we can measure, spirituality explains what we can't yet. Same thing, different timelines. And I'm going to prove it to you.

I have gathered what I learned over the last decade into 7 universal truths of existence. These are the invisible codes behind everything we experience. You will get a glimpse of the cosmic design, and find it answer most of your existential questions.

Each truth serves as a foundation for the next, and each is supported by science, so the knowledge could benefit my fellow rational friends out there. These truths are meant to awaken your consciousness to a higher dimension, where awareness itself brings you back to the present – the only point of power where you break free from your default settings, and reclaim your choice.

May this knowledge guide you towards realizing the highest version of yourself, one who walks this life with abundance and bliss.

Truth I

Duality

We live in a world of pairs.

Light and dark.

Love and hate.

Life and death.

It's the way this world is set up, a code of this material dimension that runs through everything, from the biggest experiences we go through to the tiniest particles that make up life. No one can break this law, but hidden in that contrast lies the secret to rising above the polarity.

You can be the kindest person in the world, but when you're hurt, you'll notice darkness rise within you. No matter how much you love someone, there will be a time when the feeling of hate arises. It doesn't diminish the fact that you still

hold kindness and love, but at some point, it seems inevitable that you experience the opposite.

If you analyse any situation deeply enough, you will discover that every event has both a good and a bad side. Things that are good for you might not be seen as beneficial for others. When you choose to leave a soul-sucking stable job to chase your passion, you could be going against your family's wishes, or disappoint your boss who has poured his heart into nurturing you. When you turn down plans to give yourself time to recalibrate and recharge, your absence could cause frustration or resentment in your friends. Even when we admire the heroes who volunteered to save the victims of catastrophic events, the unseen cost is that they risk their own lives and sacrifice precious time with their children and families. It just takes perspective and time to see that what seems best has its downside, and what seems worst holds a silver lining.

Opposing forces are inevitable in this world of duality. When there's good, there will also be evil. Paradoxically, villains and tyrants who caused harm to many often believe they are good. Nobody truly sees themselves as bad, because in their own story, they always have a good reason.

So I have a question for you: do you believe there is more good or more bad in the world?

Keep that question in mind as we go on, and by the end of this chapter, see if your answer changes.

Reality in Two States

The duality nature of our realities have been proven by science more than a century ago. In 1905, Albert Einstein ran one of the first experiments to reveal that light is not just a wave, it also behaves like tiny particles called photons.¹ This study explained the photoelectric effect that later won him the 1921 Nobel Prize in Physics. It showed that when light of a certain frequency was shined on metal, electrons were released, indicating that light is made of tiny energy packets. Later in 1927, Clinton Davisson and Lester Germer turned things upside down again. They proved that even particles, like electrons, can behave like waves.²

Wave-particle duality is one of the core ideas of quantum physics. This discovery changed our understanding of reality and became the cornerstone of modern quantum mechanics.

Light is not just a wave, and matter is not just particles; they are both, depending on how you observe them. Everything in existence holds two expressions of the same truth.

¹ Albert Einstein, "On a Heuristic Point of View Concerning the Production and Transformation of Light," *Annalen der Physik* 17 (1905): 132–148.

² Clinton Davisson and Lester H. Germer, "Diffraction of Electrons by a Crystal of Nickel," *Physical Review* 30 (1927): 705–740.

Water can exist as a drop or a wave; they are one and the same.

So it is with everything in the universe. Depending on our perspective, they behave as solid, measurable particles, and other times spreading out like invisible waves of probability.

Polarity of Existence

Beyond science, many spiritual teachings recognize the principle of duality at the heart of existence.

The world is created in pairs—night and day, light and darkness, male and female. — Islam

There exists a constant tension between spirit and flesh, good and evil, life and death. — Christianity

Purusha (consciousness) and Prakriti (matter) are two halves of one reality. — Hinduism

Self and other, existence and non-existence—both arise together. — Buddhism

In nature, everything works in pairs: the tides rise and fall, seasons warm and cool, birth comes with death. This is not coincidence, it's balance. Duality is nature's law of equilibrium.

Ecosystems thrive through predator and prey, the human body maintains health by balancing rest and activity, nature constantly holds opposites in tension to create

harmony. Without cold, heat has no meaning. Without decay, new life cannot emerge.

Nature has always been a master of balance. If you look back far enough, you'll see that the Earth has never stayed the same. For millions of years, it has shifted between ice ages and warmer periods, almost like it's breathing in slow cycles.

During the last 2.6 million years, what scientists call the Quaternary period, glaciers grew and melted over and over again, carving out valleys, shaping oceans, and changing the way humans spread across the planet.³ These big shifts were guided by natural forces, such as the changes in Earth's orbit and tilt, volcanic eruptions, and the rhythm of the sun itself.⁴

But what is happening today is different. The planet is heating up much faster than it usually does. In just a little over a hundred years, Earth has warmed by more than one degree.⁵ Normally, that kind of change takes thousands of years. That's why people are worried. The natural cycle hasn't stopped, but human activity is speeding it up beyond its normal pace.

³ National Oceanic and Atmospheric Administration (NOAA), "Glacial and Interglacial Periods,"

⁴ J. D. Hays, J. Imbrie, and N. J. Shackleton, "Variations in the Earth's Orbit: Pacemaker of the Ice Ages," *Science* 194, no. 4270 (1976): 1121–1132,

⁵ Intergovernmental Panel on Climate Change (IPCC), *Climate Change 2021: The Physical Science Basis*, ed. V. Masson-Delmotte et al.

And yet, nature always have a way of correcting itself. Balance will be restored, one way or another. It's not just the climate that follows this rule, life does too. Populations can grow quickly, but when they push beyond what the environment can sustain, nature eventually bring them down through limits like disease, famine, or resource scarcity. This idea goes back to Thomas Malthus in the late 1700s, and modern ecology calls it the Earth's "carrying capacity."⁶

We can observe a pattern in history where long-standing extremes often provoke a strong reaction that swings the pendulum the other way. For centuries, patriarchal systems placed women in subordinate roles, denying them education, freedom and opportunities. The rise of feminism after generations of oppressions is so powerful that it shook the old order. Social norms have been reshaped to value women's independence and achievement, giving them access to positions of leadership that were once closed off. However, the movements' intensity has also sparked tension, with some individuals reacting strongly, or even taking offense at the smallest hint of traditional masculinity or patriarchal assumptions. Men have started to feel weaker and less in control as strong feminism transform

⁶ Thomas Robert Malthus, *An Essay on the Principle of Population*, ed. Antony Flew (Harmondsworth: Penguin, 1970)

society, and in some families, the power dynamics has evolved so much that men have very little say.

We've moved from one extreme to another, and only with time do we see the harm on both sides. Eventually, we're forced to acknowledge the imbalance, and learn how to understand the needs of both parties, and finding a healthy middle ground that can become the new norm. Almost every movement, from LGBTQ+ rights to Black Lives Matter to Gen Z protest against wealth inequality, follows this pattern. The pressure builds for so long that when the weight of injustice is released, it erupts with great intensity. Only later does the movement begin to calm and move towards balance.

In the end, no extreme lasts forever. When one side grows too strong, nature always restores harmony, through cycles of growth and decline, or the rise and fall of power. This process can take centuries, but it's ultimately the universe built-in way of reminding us that wholeness is never one-sided.

The Duality Within

Duality isn't just out there; our inner world is built on opposites too. Carl Jung taught that for every quality we show, there is an equal and opposite side hidden within us. If we see ourselves as strong, somewhere inside we also carry

weakness. If we live as kind, there is also a potential for evil. This hidden side is what Jung called the shadow, the parts of ourselves we reject or keep unconscious.⁷

Taoism calls this Yin and Yang—opposites are not enemies, but partners in flow. They're not in contrast, but rather in motion. Every extreme carries its opposite inside.

⁷ C. G. Jung, *Aion: Researches into the Phenomenology of the Self*, trans. R. F. C. Hull, vol. 9, part II of *The Collected Works of C. G. Jung* (Princeton, NJ: Princeton University Press, 1968), 8–10.

The law of relativity states that nothing can be known without its opposite. We only know "big" because we've seen "small", we feel "happy" because we've experienced "sadness". Without darkness, we wouldn't recognize light. Everything exists because of comparison, meaning comes from the contrast as one side helps define the other.

Even so, know that polarity is not made of two separate forces. They exist on the same scale like two ends of a line, two sides of the same coin. Masculine—feminine , success—failure, giving—receiving, each represents a different expression of the same continuum, one cannot exist without the other. What we call opposites are, in truth, parts of the same whole.

The tension between these opposites is a brilliant design that became the very source of growth and energy. Every living system grows when it is challenged. Our muscles get stronger with every heavy lift; trees deepen their roots when strong winds push against them. Human beings evolve in the same way. A life without opposition quickly becomes stagnant and flat.

At the individual level, this tension shows up as cognitive dissonance. When our inner world holds two opposing truths: what we feel versus what we think we should feel, craving change yet resisting it, that discomfort that rises from internal friction births self-awareness. It forces us to confront outdated identities or beliefs inherited from

culture or family. Without that internal conflict, we wouldn't question anything and would never grow.

Every stress you carry, whether it's emotional, mental, or spiritual, is the soul asking to grow. Depression, then, can be seen as a profound discomfort with the current state of being, signalling a need for self-realization, meaning, and consciousness. Medication can only help by controlling the chemicals in our body, it is especially effective in acute or severe cases. However, medication alone is not a permanent solution as relapse rates remain high and it does not address the root causes.⁸ To heal fully, you need to do the inner work of reconnecting with yourself, understand the real sources of your pain, and learning the skills to face them with clarity instead of avoidance. In this sense, it is not that you heal depression, rather, with awareness, depression can become the very thing that heals you.

⁸ Fu, Eileen, et al. "Discontinuation of Antidepressants after Remission with Antidepressant Medication in Major Depressive Disorder: A Systematic Review and Meta-Analysis." *Journal of Affective Disorders* 328 (2024): 115–24.

"When people see things as good, other things become bad.
Being and non-being create each other."

TAO TE CHING

The Ego's Play

Duality isn't the final truth; the play of contrast is just the surface. It is the way our ego identify and learn about the world, form likes and dislikes that further solidify our individual identity. Yet many people become attached to identifying with a particular group that they breed hostility towards those who doesn't share the same beliefs or values. They have fallen into the ego's play of duality as they immerse themselves so fully in the character, forgetting that they are the player with access to a larger perspective.

A person who understands duality becomes relaxed, as their vision widens, and they no longer see things from just one side. When you can reframe duality, acceptance and compassion comes almost immediately. Understand that if you love, hate will also show up. Accept that negativity inside you and accept your partner's flaws along with their strengths, that's how you are able to communicate openly and listen without judgment.

If you work too hard and ignore rest, it will come a time that your body will force you to stop and reset the balance. Don't resist it. Don't cling to only the positives. That resistance is what creates suffering within you. As within, so without.

Instead, observe it like you observe your breath.

In and out. Natural. Passing.

A situation you labelled as bad, for example, a breakup or a job loss, is at the same time good. It clears space for someone more aligned to enter. As for job loss, it gives you the opportunity to look at a career or passion you'd never have considered otherwise.

The way we see a situation depends a lot on how we frame it and what we attribute it to. When you frame a challenge you face as life being unfair towards you, it becomes unbearable. If you frame the same situation as a chance to level up and become stronger, you'll find the motivation to overcome it.

When somebody hurt you and you decide that it was because they hate you or they are evil, anger rises. But if you see it as them projecting their inner struggles onto you, you can respond with grace. The truth is, most people act from their own experiences, wounds, and insecurities. Their words and behaviour are reflections of what they carry inside, not a judgment of who you are.

When you see it that way, nothing feels personal anymore. Their reaction is theirs, not yours. You stop carrying the weight of other people's anger, criticism, or rejection. Instead, you see it as a glimpse into their story. And in that moment, you're free, no longer controlled by others' behaviour.

Such
loneliness

Such
freedom

Here's a framing to consider: every difficult person you meet carries a lesson meant for your growth. Some are here to awaken strength within you, some to remind you of your boundaries, and some simply to help you practice love and detachment. See it not as punishments, but as life's calling to rise higher.

From a Jungian perspective, when we meet someone who triggers us, that reaction often reveals something unresolved within us: the shadow, repressed parts of ourselves we don't want to acknowledge. People act as mirrors to our unconscious patterns, insecurities, or desires. Of course, not every painful interaction is about your inner reflection, sometimes people are just acting from their own wounds. Refrain from self-blame and recognize what the situation reveals or awakens in you.

In all circumstances, by watching both sides of duality equally, something awakens in you: awareness. You become the one who sees both sides, fully, without being pulled by either.

"Duality is the way of the mind. Life itself is not divided, only the mind divides. When you witness both sides, you rise into a third dimension—the witness, sākṣin."

OSHO

Freed from the battle between right and wrong, you simply see things for what they are. And from that space of clarity, compassion comes naturally. Because you now understand that everyone is just acting from their level of awareness.

In the same way, Jung's view of duality resonates: We are not just one side of the coin. We are both. It is by embracing both sides that we become whole. The shadow isn't something to destroy; it's something to recognize and integrate. To be whole is to accept both light and dark within, and true strength and freedom come when we dare to face what we fear or dislike in ourselves.

Breaking Free from Illusion

Duality is the law of this world. It keeps nature in cycles, it gives life its rhythm. But it's also *Maya*, an illusion. It is a veil that tricks us into thinking we're separate.

Seeing things from a higher awareness, you will no longer pick a side and condemn another. There's no side that should or should not be there. Choosing a side is what creates chaos in you. Acknowledge your own flaws and the challenges that comes your way, just as you celebrate your strengths and successes, for together they shape the wholeness and depth of your journey on earth.

Beyond duality, is oneness. Call it God consciousness, universe, the divine, the names don't matter. What matters is that the pairs dissolve, the opposites merge, and you see the ultimate reality as it really is—*Advaita*, non-dual.

So, is there more good or evil in the world?

Truth II

All is One

You, a penguin, a rock, and this earth?

We are all made of the same thing.

You might read this as a philosophical reflection, but it is an accurate scientific statement about the nature of our universe.

There is a reason this foundational concept was hidden from the masses, spoken only in parables and metaphors. Because once we remember our oneness, we are no longer easily controlled. We stop feeding the systems that profit from our disconnection, the endless chain of status and consumption.

The Universe in a Particle

When you strip everything down to its smallest element, you find atoms. Whether it is hydrogen in the stars, carbon in our bodies, or oxygen in the air we breathe, they are all just protons, neutrons, and electrons in different arrangements. We are literally built with the same Lego blocks, rearranged into stars, trees, and...you. Which means the entire universe, from galaxies to you sitting here, is built from the same base.

Ernest Rutherford's gold foil experiment in the early 1900s changed everything as they split atoms open: atoms are not solid at all. They're mostly empty space, with electrons buzzing around a tiny nucleus.⁹

So if we're mostly empty space, why does the world feel solid?

⁹ Ernest Rutherford, "The Scattering of α and β Particles by Matter and the Structure of the Atom," *Philosophical Magazine* 21, no. 125 (1911): 669–688.

The Atom

The word atom comes from the Greek word meaning "indivisible", implying that an atom is the fundamental unit of matter. Each element carries its own unique pattern because every atom vibrates differently. At its core lies the nucleus, a center of positive charge, surrounded by negatively charged particles called electrons, constantly in motion within their orbits.

Here is the answer: Emptiness isn't really empty.

Just as the Heart Sutra says, "Form is no other than emptiness, emptiness is no other than form. Form is only emptiness, emptiness is only form."

Emptiness essentially, is energy.

What looks like nothing is what allows everything to exist.

The electrons in your hands and the electrons in the table are pushing against each other like invisible force fields. That is why we have the perception of touch¹⁰. But at the deepest level, we're all energy. Vibrations. Patterns.

Once you really understand the unification of the foundation of our reality, separateness didn't make sense anymore. It is an illusion.

Divine Oneness

All is connected. Every thought you carry ripples through the collective. You are the wave, and at the same time, the ocean. This is why the wisdom of every culture, every faith, comes back to the same thing: Love. Compassion. Kindness. Because when you hurt others, you are really hurting another version of you.

¹⁰ "The Science of Touch," *PSU Vanguard*.

"Thou art that." (You are the universe itself.)

UPANISHADS

"All things originate from one essence."

BUDDHA

"O mankind, We created you from a single soul..."

QURAN 4:1

"That they may all be one. As you, Father, are in me and I
am in you, may they also be in us."
(John 17:21)

JESUS

"You are not a drop in the ocean.
You are the entire ocean in a drop."

"All religions, all this singing, one song.
The differences are just illusion and vanity.
The sun's light looks a little different on this wall than it
does on that wall, and a lot different on this other one, but
it's still one light."

RUMI

"The One is pervading among all, within and beyond.
The soul is not different from the Supreme Soul;
the Divine Light is in all."

GURU GRANTH SAHIB

"A human being is part of a whole, called by us 'universe,'
a part limited in time and space. He experiences himself,
his thoughts and feelings as something separated from the
rest... a kind of optical delusion of his consciousness."

ALBERT EINSTEIN

Marsilio Ficino, a Renaissance philosopher and translator of Plato, revived the concept of *Prisca theologia*, or “ancient theology,” asserting that all true religious and philosophical teachings originate from a single divine source.¹¹ This monistic wisdom, he argued, was revealed by God and preserved in the Egyptian tradition as well as in the teachings of prophets and sages, such as Moses, Orpheus, Pythagoras, and Plato. Ficino’s vision emphasized the unity underlying apparent diversity, a principle later pursued by Enlightenment-era natural philosophers in their search for universal laws.

Inspired by this monistic perspective, Isaac Newton sought to uncover the same divine order within the natural world. Through his formulation of universal laws of motion and gravitation, he demonstrated that planets, comets, and earthly objects all obey the same principles, reflecting a single, coherent design underlying all creation.¹² Beyond mathematics and physics, Newton studied alchemy and scripture, interpreting the transformations of matter and the patterns of history as reflection of a harmonious, divinely ordered structure.¹³ On the multiplicity of planets, elements, and natural phenomena, he wrote, “these things all are one

¹¹ Marsilio Ficino, *Three Books on Life*, trans. Carol V. Kaske and John R. Clark (Binghamton, NY: Medieval & Renaissance Texts & Studies, 1989).

¹² Isaac Newton, *Theological Manuscripts of Isaac Newton*, ed. H. McLachlan (Liverpool: Liverpool University Press, 1950).

¹³ Betty Jo Teeter Dobbs, *The Foundations of Newton’s Alchemy; or, “The Hunting of the Greene Lyon”* (Cambridge: Cambridge University Press, 1975).

thing, though there be many names." His work offered a compelling integration of natural law and theological monism, marking a transition from Renaissance thought to early modern science.

The 20th century saw the emergence of quantum physics, which unveiled some of the most surprising aspects of reality. Quantum entanglement, what Einstein jokingly called "spooky action at a distance", revealed that when two particles become entangled, they remain connected no matter how far apart they are. If one particle changes, the other instantly reflects that change.¹⁴ ¹⁵ Together, these discoveries describe the same thing: the universe is deeply connected, beyond what our senses can perceive.

As Stephen Hawking asks in *Brief Answers to the Big Questions*, how can our finite minds comprehend an infinite universe? Isn't it pretentious of us even to make the attempt?

Even though some occurrences seem random, there is really no such thing as coincidences. Sometimes, you think about a friend, and they suddenly text you. Or the same number sequences keep appearing before you, 1111, 444, 555, just when you're questioning your path. These are what we call synchronicities, they feel too aligned to be random.

¹⁴ Albert Einstein, Boris Podolsky, and Nathan Rosen, "Can Quantum-Mechanical Description of Physical Reality Be Considered Complete?" *Physical Review* 47, no. 10 (1935).

¹⁵ Alain Aspect, Philippe Grangier, and Gérard Roger, "Experimental Realization of Einstein-Podolsky-Rosen-Bohm Gedankenexperiment: A New Violation of Bell's Inequalities," *Physical Review Letters* 49, no. 2 (1982).

Chances are you haven't noticed, yet the universe is constantly communicating with you in different ways, often through signs and timing. The more aware you become, the more these patterns reveal themselves to you. You just have to quiet the mind, and pay attention.

Hawking's answer is ultimately affirmative: despite our limitations, we can, and should, attempt to understand the universe. Understanding the world we live in helps us live better lives. It teaches us humility by showing how small we are, responsibility by revealing how interconnected everything is, and meaning by reminding us that our brief lives are part of a much larger story.

Every encounter or delay is connected by a design we can't fully see from the dimension we are in; a pattern that becomes clear in the future when we have grown enough to understand its significance.

Look back on your life. Can you see how your pain and your lowest moments now serves you? How they had a purpose of shaping you into who you are today? Your toughest moment often holds the catalyst for your greatest success.

Everything you experience is part of a bigger plan. Your words and actions ripple through the whole, and what you give always finds its way back. So when you act with love, you are expanding it within the same whole that you are part of. When you cause harm, another point of the same existence you share suffers, not someone separate. The

boundaries we see between self and other, giver and receiver are part of the illusion.

Life isn't happening to you, it's happening with you.

At the deepest level, we are all expressions of one field, one consciousness moving through countless forms.

Infinite love

Once I understood this, my worldview shifted.

I started to love everything.

The sky.

The birds.

Plants.

Water.

Wind.

My neighbours.

My enemies.

The walls around me.

The energetic space.

How could your heart not be filled with love?

The good and the bad, it's all you, it's all one.

Such love is not of attachment, possession, or demand. It's the kind that arises when you see yourself in

everything. You begin to love without a reason, driven by neither need nor fear, cling nor control.

Unconditional love is not an emotion that rises and fades; it is a state of being. When you love from this place, you stop trying to hold on. You simply appreciate, allow, and trust. You want them to grow, even if it means growing apart. Because real love doesn't bind, it liberates.

Each soul is a mirror of your own, each on its own path of becoming.

Once you embody love, you will realize that the overflowing love within you is your true source of power. It is the ego killer, dissolving greed, cruelty, jealousy, and fear. All negativity, when traced back, is rooted in the human instinct to protect oneself; fear of getting hurt, abandoned, or rejected turn into selfishness, suspicion, manipulation, resentment, and hatred.

Infinite love is the key to end the cycle of distrust that divides humanity. It cultivates gratitude, and with gratitude and contentment come the ability to heal oneself, the courage to give freely, and the compassion to transform anger and hatred into understanding.

"He learned the most important part of the language that all the world spoke, the language that everyone on earth was capable of understanding in their heart. It was love. Something older than humanity, more ancient than the desert."

PAULO COELHO
THE ALCHEMIST

Different names, different traditions, the same essence.

Boundless love, beyond labels.
The universal language reminds us:
We are one.

Loving everything is loving yourself.
Nothing is really in conflict, it's all you.

You are the wisest sage, and the darkest evil; you are the predator, and the prey; you are the character in game, and the player with the controller; you are the creator, and the destroyer.

We are not human beings having a spiritual experience, we are spiritual beings having a human experience.

Infinite love is within us all. As we embrace it, we evolve, and in doing so, we raise the consciousness of the world.

Now that you're aware of our true nature: duality as the play we live in, oneness as what we are. From here, how do you create the life you truly want?

Truth III

Perceived Reality

If you don't like your current reality, you can shift into a new one. Seeing the truth means realizing that your conscious experiences are nothing but your brain creates. Take a good look around you, this is a world of your own creation.

The mind operates across three interacting layers: the conscious, the subconscious, and the superconscious. The conscious mind consists of the mental processes of which we are presently aware. The subconscious contains memories, emotional conditioning, and learned patterns that influence our behaviour and interpretation, often without conscious awareness. The superconscious transcends ordinary consciousness and is associated with intuition, creativity, and universal consciousness. Together, these layers determine how sensory input is selected,

organized, and given meaning. Because each person's subconscious patterns and attentional focus are different, the same external reality can be experienced in profoundly different ways.

Have you heard about the Rashomon effect? The term comes from Akira Kurosawa's 1950 film, *Rashomon*, where the murder of a samurai is retold from four different perspectives: a bandit, the samurai's wife, the samurai himself (speaking through a medium), and a woodcutter who claims to have witnessed it. The shocking part is that in three of these testimonies, each person confesses to being the killer, but for completely different reasons shaped by pride, guilt, or self-interest.

Psychologists later borrowed the term to describe a truth about memory and perception: we don't record events like cameras, we interpret them.¹⁶ Culture, emotions, and personal biases all shape the way we recall and explain what happened. That's why the same event can splinter into multiple realities. Truth is rarely a singular, objective reality, but often a collection of overlapping, subjective experiences.

The truth you live by right now is largely inherited, not chosen, by you as you grew up. It's a construct handed to you piece by piece, every day through family, media, school, and society. You did not choose most of it, you absorbed it.

¹⁶ Daniel Reisberg, "Memory: General Considerations," in *Cognition: Exploring the Science of the Mind*, 5th ed.

What you call "normal" is really just a collection of beliefs, stories, and rules passed down from others.

The anger, fear, and anxiety in you, most of them aren't even yours. They're products of the collective thought and conditioning. Perception is fluid, not absolute, unless you choose to live inside a mold shaped by others before you. Change your perception, and watch your reality changes with it.

The Multiverse We Live In

You have probably heard of the double-slit experiment. In this famous quantum physics study, when a particle isn't being watched, it behaves like a wave. This means it exists in a superposition of infinite possibilities. But the moment it is observed, it collapses into a single, fixed point: a particle.¹⁷

This discovery revealed the essence of reality: it doesn't exist in a solid form until it's observed. The very act of observation (consciousness), collapses potential into the real. In a way, it is like how a game engine works. The world is not rendered all at once, only the parts your character looks at. The moment you shift your focus, the rest of the scene comes alive.

¹⁷ Thomas Young, *A Course of Lectures on Natural Philosophy and the Mechanical Arts* (London: Joseph Johnson, 1807).

Reality functions much the same way. Consciousness is the observer, and observation brings the code of existence into form. We are in a holographic reality that is the projection of consciousness. Without observation, it's just potential.

Science shows that the world we live in is essentially made up of energy vibrating at different frequencies. Light waves, sound waves, even your brain waves, all are frequencies.

And according to quantum physics, at any given moment, there are infinite realities existing simultaneously.¹⁸ Every possibility you can imagine, and even the ones you can't, already exists in the quantum field.

¹⁸ David Wallace, "Many-Worlds Interpretation," *Stanford Encyclopedia of Philosophy*.

What we experience depends on which version of reality we align with, through thoughts and emotions.

Lens of the Mind

Deciding the reality you prefer doesn't require building anything from scratch, you're shifting into the version that already exists.

Many people hold tightly to the way they see the world, and that blocks them from rising into a better reality. Principles are one of those things people cling a little too hard to, even after those beliefs begin to limit them. For instance, some people take rules seriously and see anyone who breaks them as a jerk. Abiding to the rules makes them feel safe and in control, even when it's costing them a loss of time or freedom of expressions. But it's only natural that life sometimes asks for a little flexibility, and when that happens, holding on to the principle will only create stress and inner conflict. Small choices may become a burden, leading to arguments or relationships falling apart, all in the name of an illusion to stay "consistent" or "good" in their own eyes. The fear of being seen as a hypocrite and judged for contradicting their own words intensifies the pressure, causing people to hold more firmly to their principles. But that fear is also a lens they choose to view the world through. People might comment or question you when you break a

principle they know you for, but you get to decide how much those voices matter.

Even the strongest values that are seen as good moral guides need flexibility. Take honesty, for example, most of us value telling the truth. But when it becomes rigid, it can create problems. If someone discovers that a friend is cheating on their partner, their principle may push them to speak the truth. Keeping it hidden torments them as the voices in their head take over, making it almost impossible to act natural around the people involved. Finally speaking up can bring relief, a sense that they've done the right thing, even though it come at a cost of hurting others. Most people don't realize it, but we have a choice in the voice we listen to. Those voices are lenses that shape how we see reality, change them and your perception of reality changes with it. When you bring in consciousness, you will find that you are in control, not the thoughts running through your minds.

You were never meant to live inside fear and lack. Every event is fundamentally neutral; nothing carries a built-in meaning. The meaning your mind assign to something is what gives it power over you.

We humans gave sounds meaning. We made up languages, and decide if a sound is considered good or bad. The same behaviour can mean one thing in one culture and something very different in another. Beauty standards have evolved over time and vary widely across cultures. In Japan, slightly crooked teeth are considered cute and charming,

while in Western cultures, straight, perfect teeth is seen as attractive. In Renaissance Europe, fuller faces and rounded cheeks were considered beautiful, symbolizing wealth and health. Today, many Western standards favor more angular faces with high cheekbones. So if you feel like you're not attractive, maybe it's just that you've been trying to appeal to the wrong crowd. Have confidence in who you are, the world will eventually come around.

The lenses you choose play a big role in determining the heights you reach in this lifetime. The mindset that sets successful people apart from those who are equally talented but never seem to get far is how they view failure. We usually only see successful people once they are in the limelight, but we don't see the many times they messed up, get rejected, or had to start over before getting to where they are today. If you attribute failure as something shameful and as proof that you don't have what it takes, you will quit before you even get to put in your best effort, or you might never start at all. Some people put off chasing their dreams, thinking they need to be perfectly prepared to avoid failure and achieve success on their first try. What they fail to see is that fear of failure is the real barrier between them and the reality they desire. No amount of preparation in the future will help if that fear remains, reaching success will be just as difficult as it is today when you're beginning from scratch.

Every failure is a step closer towards your goal. Treat it as learning, then not only will you be grateful for the

lessons, but it will also give you the courage and excitement to take risk, keep going and keep improving. Failing is not embarrassing at all as long as you don't let it hold you back from discovering yourself and what you really want in life.

"I've failed over and over and over again in my life.
And that is why I succeed."

MICHAEL JORDAN

You will start to see that every event has multiple angles, and how you choose to interpret them shapes your experience. With that said, different conclusions are often drawn from the same situation depending on how we attribute the causes, which ultimately shapes our emotions and worldviews. The Attribution theory explained how our interpretation and response to an event is determined by our "frame" of view.

Events are often interpreted based on two key dimensions: locus of causality (Internal vs. External) and locus of stability (Stable vs. Unstable). By combining these two dimensions, we get four possible lenses of the same situation.

Weiner's Attribution Theory

Example: When someone treats you badly.

	Internal	External
Stable	Ability <i>"They're a bad person."</i>	Task Difficulty <i>"People are always mean."</i>
Unstable	Effort <i>"They're upset right now"</i>	Luck <i>"They're having a bad day."</i>

When we see others' mistakes as internal, we tend to judge them.

When we see them as external, caused by circumstances or other stressors, we feel compassion.

Same goes for own failures. When we interpret them as internal, we feel guilt or shame; but when we see them as situational, we allow forgiveness.

An internal-stable story says, "This is who I am," while an external-unstable story says, "This is what happened. The story you choose becomes your emotional reality.

Life will never be without mistakes or setbacks. How we interpret these moments determines how we experience them and how we move forward. The more you shift from identity-based blame to situational understanding, the freer you become. Over time, this rewiring of perception builds emotional resilience and allows you to engage with life and its uncertainties with confidence and openness, without carrying unnecessary guilt.

"Thoughts in your head are really no different than the sound of a bird outside. It is just that you decide that they are more or less relevant."

ADYASHANTI

The Cage is Open

In 1955, Dr. Henry Beecher published a paper in the *New England Journal of Medicine*, revealing that belief alone could trigger real healing, what we now call the placebo effect.¹⁹ Since then, countless studies have confirmed this mysterious power of the mind. Patients who received fake surgeries healed as if they had the real procedure;²⁰ brain scans of Parkinson's patients showed increased dopamine release following saline injections, purely from expectation of receiving a dopamine-enhancing drug.²¹ These studies shows how deeply the mind shapes our biology. Most of us have barely scratched the surface of what it can do.

Throughout history, certain individuals have awakened to the truth that threatened the systems of power. In the time of Jesus, the Roman Empire and the Pharisees held complete control over the people through laws and belief. When Jesus said that “the kingdom of God is within you” (Luke 17:21), he was revealing a liberating and revolutionary truth: divinity is not something you must seek externally, but something alive within your being. It was rebellion by awareness that terrified those in control.

¹⁹ Henry K. Beecher, “The Powerful Placebo,” *Journal of the American Medical Association* 159, no. 17 (1955).

²⁰ J. Bruce Moseley et al., “A Controlled Trial of Arthroscopic Surgery for Osteoarthritis of the Knee,” *New England Journal of Medicine* 347, no. 2 (2002).

²¹ Raúl de la Fuente-Fernández et al., “Expectation and Dopamine Release: Mechanism of the Placebo Effect in Parkinson's Disease,” *Science* 293, no. 5532 (2001).

After his death, the empire eventually adopted and institutionalized his teachings, turning a message of inner divinity into one of obedience and hierarchy. And through the centuries, anyone who carried "forbidden" knowledge—healers, mystics, and women called witches, were silenced, punished, or burned. Because when people begin to realize their inner divinity, they become ungovernable by fear and systems that profit from separation.

Around 2,500 years ago, Siddhartha Gautama, the Buddha, also sought truth beyond religion and found enlightenment through direct experience. Similar to Jesus, he realized the divine was never outside of us. They walked different paths, yet came to the same truth: liberation comes from within. They didn't ask to be worshiped, they asked us to wake up.

Today, you might see people online performing telekinesis, bending spoons or redirecting the wind with nothing but intention. It is easy to dismissed them as tricks and scrolled past without a second thought, but just know that the same potential lies within you. What you can see, you can achieve, as long as you are willing to believe.

Times are changing. We are in the age of Artificial Intelligence, an era where human labour is no longer the driving force of progress, but a cost to be minimized. We will see a shift from control and manpower to automation and intelligence. For many, this means that jobs once considered secure may vanish, pushing people to rediscover new ways

to create value and meaning. We stand at a unique moment in history, where freedom of speech and human rights are recognized and celebrated, where we no longer have to speak in metaphors. We have more freedom to actualize our infinite potential than any generation before us. The tools exist. The access exists. What remains is the choice to use them.

The Untold Secret

Within each of us lies the same intelligence that make up the whole universe and existence, you simply have not been taught how to access it. To fully experience the game, the programmer must forget the code and find their way back to it. That is what the journey is for.

Now that you remember, I invite you to reflect on your current reality. Do you like the way it is? Would you like to experiment using your mind to bend your reality in your favor? Fun fact: you can even change how someone behaves towards you by changing your perception of them in your mind. Sometimes the change happens instantly, other times it unfolds gradually. But it will happen. We will talk more about timing in Truth V.

If you want to be loved a certain way, start by loving yourself that way. Because reality mirrors you, not your wishes, but your state of being. If you want to be the luckiest

person alive, start by knowing that the universe already has your back.

I hope you understand that nothing outside can truly affect you unless you allow it to. You choose whether to accept or reject the meanings, the emotions, and the projections around you.

Taking full accountability for your reality can be uncomfortable at first, even scary. It means you can't blame anyone or anything else anymore. But once you decide to turn inward and recognize the power that has always been within, something shifts, and it's both freeing and empowering.

The truth is a mirror in the hands of God. It fell, and broke
into pieces. Everybody took a piece of it, and they looked at
it and thought they had the truth."

RUMI

Awakened vs Enlightened

Just as no two people share the same reality, no two spiritual awakenings are ever alike, even though all paths ultimately lead to the same higher source.

But keep in mind, awakening and enlightenment are two different things. Enlightenment is the final realization, the state of full awareness where you no longer fall back asleep. You can have many awakenings along the way, but enlightenment is when you truly become one with the Source. Knowledge can only carry you so far. True enlightenment has to be lived.

With spiritual leaders spread across time and continents, each expressed their wisdom through unique terms, stories, and symbols shaped by their own experiences and cultures. Over generations, these teachings were passed down and reinterpreted by new teachers and gurus, and subsequently evolved into the diverse beliefs and perspectives we have today.

Have you ever heard survivors of serious accident or near death experience describe their miracles? While some see angels, others see deities of their own religious belief appearing before them. They were offered a sense of reassurance that shielded them from greater harm and helped them survive. And in every case, the experience strengthened their faith that they were being guided or protected by a higher power.

The comforting thing is, the universe always present itself in a way that is most friendly to us, that is familiar and fitting to the existing images in our mind, so we won't freak out. It is not that any of the survivors are lying, is it just that our mind is a powerful lens that decides what we see.

Even when it comes to a book, different readers will take away different meanings. Both are true in their own way, and both deserve respect. Every interpretation reflects the reader's own journey and state of mind, and when put together, these perspectives form the full picture.

"What happens in our mind now in life is exactly what will occur in the states at death, since essentially there is no difference; life and death are one in "unbroken wholeness" and "flowing movement."

SOGYAL RINPOCHE
THE TIBETAN BOOK OF LIVING AND DYING

Our thoughts literally create the world we experience, even after death. At the moment of death, our mind and emotions lead the way. Consciousness itself becomes the path, deciding where we go next. Without a physical body to ground us, thoughts manifest as reality almost instantly.²² A single positive thought can open the path to enlightenment, and a single negative reaction can plunge you into suffering.

So it is crucial to understand the nature of thoughts and emotions, and of minds and perceptions when we are alive. Awareness will prevent your old habits and tendencies from seizing hold of your mind, dominating your current life and the next.

Kenneth Ring in his documentation of people who went through near-death experience recorded accounts of "judgment" as coming from own conscience. A woman told, "You are shown your life, and you do the judging...You are judging yourself. You have been forgiven all your sins, but are you able to forgive yourself for not doing the things you should have done, and some little cheating things that maybe you have done in life? Can you forgive yourself? This is the judgment."²³

The judgement came not from beings of the light, who seemed to love and accept these people unconditionally,

²² Sogyal Rinpoche, *The Tibetan Book of Living and Dying*.

²³ Kenneth Ring, *Heading Toward Omega: In Search of the Meaning of the Near-Death Experience*.

but rather from within the individual.²⁴ In the presence of overwhelming love and clarity, a person naturally recognized the truth of their life. Ultimately all judgment take place within our own mind. We are the judge and the judged. As said in Truth II, all is one.

By now, you have learned the basic programming of this game called life, it's time for the cheat codes.

²⁴ Raymond A. Moody Jr., *Reflections on Life After Life* (New York: Bantam Books, 1977).

"Samsara is your mind, and nirvana is also your mind,
All pleasure and pain, and all delusions exist nowhere apart
from your mind.
To attain control over your own mind;
This is the heart of the practice for the bardo of becoming."

TSELE NATSOK RANGDROL
THE MIRROR OF MINDFULNESS

Truth IV

Law of Vibration

"Nothing rest; everything moves, everything vibrates."

— Hermetic Principle of Vibration

All is energy. Everything in existence, even what looks like empty space, is vibration. When you zoom in far enough, nothing is truly still, not even a rock.

At the tiniest level, everything is made up of constantly moving energy. The space that seems empty around us is a field alive with invisible waves of energy constantly pulsing and interacting.²⁵

²⁵ Serge Reynaud, Astrid Lambrecht, and Maia Neto, "Quantum Vacuum Fluctuations and the Casimir Force," *Comptes Rendus de l'Académie des Sciences – Series IV: Physics 2*, no. 9 (2001).

You might be surprised to learn that no two things actually “touch.” The reason your body doesn’t pass through a wall is because of a quantum rule called the Pauli Exclusion Principle. It basically says that two identical particles, like electrons, can’t exist in the same state or space at the same time. As they come close, their energy fields push against each other, creating a sensation of resistance.^{26 27}

The states of matter that we learned are solid, liquid, and gas, but in truth, they make up a tiny fraction of existence. About 99% of the visible universe, from the sun and stars to lightning, is made of plasma, the fourth state of matter.²⁸ Plasma forms when a gas becomes so energized that its electrons break away, creating a charged medium that can carry electricity and respond to magnetic fields. Even within us, blood plasma mirrors this role. It is the fluid that transports nutrients and hormones throughout the body, acting as a carrier and communicator of life in the same way cosmic plasma carries and moves energy through the universe.

Nikola Tesla recognized the power of energetic mediums before these ideas became mainstream. His work with high-frequency currents and wireless lighting were early explorations into plasma behavior and its potential to

²⁶ Wolfgang Pauli, *Collected Scientific Papers*, ed. Karl von Meyenn.

²⁷ Michela Massimi, *Pauli’s Exclusion Principle: The Origin and Validation of a Scientific Principle*.

²⁸ Francis F. Chen, *Introduction to Plasma Physics and Controlled Fusion*, 3rd ed. (New York: Springer, 2016)

transform how humanity understands and uses energy. Schools rarely taught this as plasma is harder to visualize and complex to explain. Yet today, it is clear that plasma is the language of the invisible, shaping both the cosmos above and the living systems within us, and understanding it changes how you see energy, matter, and consciousness.

Electromagnetism shapes plasma the same way our inner consciousness shapes energy. Plasma responds directly to electromagnetic force, which are basically expressions of vibrations. The electromagnetic spectrum, from radio waves to visible light, is energy oscillating at different frequencies. This is the bridge that completes the picture: frequency controls how electromagnetic energy behaves, and electromagnetism is the force that organizes plasma into structure.

The difference between light and sound, wood and water, and other elements are not differences in substance, but in vibration. Change that vibration, and you change the structure itself. That is why heat can melt metal and sound can shape sand into sacred geometry. Frequency creates form.

Cymatics, from the Greek word *kyma*, meaning “wave,” is the study of how sound vibrations shape matter. In the 20th century, Dr. Hans Jenny built on earlier work of Ernst Chladni by experimenting with plates and membranes

covered in sand or liquid.²⁹ When sound waves of different frequencies and amplitudes passed through, the materials arranged themselves into beautiful geometric patterns.

As the frequency increased, the patterns became more complex and refined, showing that higher vibrations create greater harmony and order.

²⁹ Hans Jenny, *Cymatics: A Study of Wave Phenomena and Vibration*.

Jenny also extended his research into the effects of voice and language. He suggested that when ancient Hebrew or Sanskrit vowel sounds were vocalized, the sand arranged itself into the written symbols corresponding to those vowels; while the same effect was not observed with modern languages.³⁰ These languages (what many call sacred sound), through their tonal frequencies, could directly influence matter and energy, reflecting a deep understanding of the universe's vibrational nature.^{31 32}

Some researchers and theorists proposed that ancient civilizations may have harnessed sound as a technological force, using frequency and resonance to lift massive stones, shape structures, and move matter with precision.³³ It explains how megalithic structures like the Pyramids, Stonehenge, the ancient city of Petra and other impossible feats of architecture could have been built. The idea that sound technology built the megalithic wonders of the world indicates that we once knew how to work with vibration.

If vibration can structure matter on a small scale in cymatic experiments, it raises the possibility that large-scale sound frequencies, precisely tuned, could once have been used to manipulate matter in ways we have since forgotten.

³⁰ Nina Munteanu, "Cymatics: How Frequency Changes," *Science of the Mind*.

³¹ Jonathan Goldman, *Healing Sounds: The Power of Harmonics*.

³² John S. Alexander, *Science and the Sacred: Science and the Sacred: Bridging the Gap Between Faith and Reason*.

³³ Leslie Kean, "The Forgotten Science of Sound," *The Huffington Post*.

The notion of “lost sound technology” suggests that what we now view as myth or magic may have been the application of natural laws that modern science is only beginning to rediscover.

Human Energy Field

The electromagnetic field is created by the movement of charged particles in the body — mainly through the flow of ions in the heart, brain, and nervous system. Every heartbeat sends an electrical signal that travels through the body and radiates outward as a magnetic field. The brain also produces electrical activity that creates smaller, more localized fields. These signals allow cells to communicate and help the body stay in sync. Scientists can measure these patterns with tools like electrocardiograms (ECG) and electroencephalograms (EEG). When our emotions change, they alter the heart's rhythm, which in turn changes the pattern of the electromagnetic field. This is why emotions can influence not only our inner state but also the energy we project around us.

Each neuron communicates through tiny electrical impulses, creating subtle electromagnetic fields that together form the brain's overall energy pattern.

Synapses pass these signals between neurons, shaping the flow of your energy and thoughts.

Now, if you think about it, your entire body is made of these same vibrating particles, constantly interacting, exchanging energy, and sending tiny electrical signals through every cell. Your nerves, heart, and brain all run on electricity. And wherever there is electricity, there is also magnetism.

Your body naturally produces an electromagnetic field, which radiates beyond your physical body as an energetic aura that surrounds you. The heart produces the strongest magnetic field, about 5000 times stronger than that produced by the brain, and is measurable several feet away by magnetometers.³⁴ These fields change depending on your emotions and thoughts, and has a significant influence on the body down to the cellular level. When you're calm, the rhythm becomes more coherent. When you're anxious, it becomes erratic.

One emerging and increasingly discussed idea in neuroscience is that the brain may communicate using light. As part of its biological processes, neural tissue emits ultra-weak light known as biophotons. These emissions span a broad range of wavelengths, from ultraviolet to visible light to infrared, which can only be detected using highly sensitive instruments. At a fundamental level, all matter emits

³⁴ Rollin McCraty, "The Energetic Heart," *Institute of HeartMath*.

photons as a result of thermal and biochemical activity, and living systems are no exception.

Recent research by Muragan and her team suggests that these biophotons may play a role in information processing within the brain. They observed that biophoton emissions changed when participants switched between different cognitive tasks, indicating a potential additional channel through which neural activity is coordinated.³⁵ This idea builds on earlier insights from Fritz-Albert Popp, who, decades ago suggested that biological light emissions were organized and communicative rather than random-by-products of metabolism.³⁶ His work was constrained by the technological limitations of the period, which made rigorous testing of functional hypotheses difficult.

Some researchers speculate that biophotons may contribute to large-scale coherence in the brain, helping to explain how it achieves real-time cognition and perception at remarkable speeds faster than synaptic models can replicate, while using orders of magnitude less energy than the most advanced artificial intelligence systems.

Neuroscientists think these findings could change how we track brain activity and understand neurological

³⁵ Casey, Hayley, Isabella DiBerardino, Mattia Bonzanni, Nicolas Rouleau, and Nirosha J. Muragan. "Exploring Ultraweak Photon Emissions as Optical Markers of Brain Activity." *iScience* 28, no. 3 (2025): 112019.

³⁶ F. A. Popp, "Properties of Biophotons and Their Theoretical Implications," *Indian Journal of Experimental Biology* 41, no. 5 (May 2003): 391–402.

disorders, and may lead to light-based therapies in the future, particularly in stimulating cellular repair and restoring neural balance.

While a rat brain emits roughly one biophoton per neuron per minute, the human brain could emit over a billion biophotons per second.³⁷ Such scale has led researchers to wonder whether biophoton intensity correlates with higher states of consciousness. It raises the question whether consciousness is closely linked to light, and possibly influenced by quantum phenomena such as entanglement, where information appears to be shared instantaneously across distance.

Interestingly, throughout history, enlightened figures have often been depicted with radiant halos, and visual symbols often associate light with heightened awareness and a deeper connection to universal consciousness.

Seen together, the faint light emitted by neurons, the electrical fields and the molecular vibrations of living tissue are interconnected expressions of how energy moves through the body. What appears inside us as perception is created by the same energetic patterns that appear outside us as matter and space. Everything is part of one continuous vibration, one field expressing itself in different frequencies.

³⁷ Big Think, "There Are Biophotons in the Brain. Is Something Light-Based Going On?," *Big Think*.

That's why when we speak, our voice transmits as vibration in the air, capable of altering moods and changing the atmosphere of a room. Music can make you cry without words. And your emotions, which are also energetic states, can affect your body and the world around you.

Can you recall someone whose presence alone seems to lift the room, someone who doesn't even need to speak for you to feel their energy? Science is still uncovering just how far the electromagnetic field of the heart extends, as technology slowly catches up to what spirituality has always known.

Scale of Consciousness

Every thought and emotion has a vibration of a certain frequency. Lower energetic frequencies are heavy states like shame, guilt, fear, and anger. They weigh you down and make life feel like a constant struggle. 'Courage' is the threshold of a turning point. Below it, life feels like it's just happening to you. Once you step into courage, reality shifts and you start to feel more in control, more alive. From there, the higher you go, into acceptance, love, joy, peace, the lighter and freer life feels.

Many people think their energy defines them. When you are stuck in sorrow or anger, it feels like that is just who you are; like life is unfair, people don't understand you, and nothing ever changes. You start to believe that is your story. But that feeling is really just a state you have been choosing, maybe for a long time, and it isn't who you are. When you realize you can choose something new, you get your power back.

As you maintain a higher frequency, you open yourself to a new reality where life begins to flow in your favor. The strength of your energetic field mirrors the frequency of your thoughts and emotions. Positive thoughts from your mind prompt your heart to generate positive emotions. The heart acts as the centre of your energy field, constantly forecasting your emotions and sending magnetic signals into the quantum field, and in turn, the energy you radiate attracts experiences that match your vibration.

That is the mechanism behind Law of Attraction. Rhonda Byrne in *The Secret* and Napoleon Hill in *Think and Grow Rich* both share ways to manifest what you desire. By focusing on what you want with clear intention, belief and positive emotion, you align your vibration with what you wish for, creating the right conditions for it to come into your reality.

The main problem with the Law of Attraction is convincing yourself that what you desire will actually happen. You can write down your wishes, feel excited, and

believe it's possible, but if part of you still holds fear or doubt, that inner resistance blocks the shift. You end up sending mixed signals, where part of you is creating what you want, and part of you is stuck in the old vibration.

Quantum Leaping

In physics, quantum leap describes the moment an electron in an atom suddenly jumps to a higher energy level without moving through the space in between. The change is significant and instantaneous.

When it comes to energy and consciousness, it is that defining moment when something clicks, and suddenly, you find yourself in a completely new reality. Your thoughts, emotions, and energy shift so deeply that you begin to see the world through new eyes, and your experience of the outer reality transforms with your inner growth. These leaps can happen naturally at any point in life, like during a sudden epiphany. Yet some choose to initiate them deliberately, collapsing the gap between their current self and the self they wish to become, accelerating the shift. In this process, it's about stepping fully into the version of yourself who already has what you desire, and changing your thoughts, emotions, and energy to match that reality.

As Within

Everything you desire already exists in another timeline held by a higher version of you. The moment you grow into the energy that matches that reality, it naturally finds its way to you.

Start by shifting your inner state. Everyone goes through times that test their strength, rather than fixing the people or the circumstances, you have more power to change your perception and the energy you project. The version of you who feels financially secure is a good match with a reality of abundance. Think, feel, and act from the energy of the you who is living your dreams.

Look back at the scale of consciousness and ask yourself: where do you spend most of your time at? If you are used to the lower vibrational frequencies, shifting upward will feel uncomfortable at first. That reaction is normal, because growth always feels this way. Discomfort is simply the brain rewiring its old patterns. Notice and accept how you feel. Talk to yourself, write down your limiting thoughts and counter them with objective truth. You are teaching your body and mind a new normal. Soon, you will feel comfortable in the higher frequencies, and by then, the lower frequencies will begin to feel out of place, because your energy is no longer aligned with them.

Let your words and actions align with that feeling every day, so you live in the same frequency as what you want to attract—money, beauty, love, health, as though they

are already yours. This is the cheat code for elevating your wellbeing and connecting with your highest self that is resourceful, abundant, confident and prosperous. When your inner world changes, your outer world follows.

So Without

Try picturing the life you want: who your friends are, how your days feel, and what your surroundings look like. You don't need to move houses or make huge changes immediately. Small steps like clearing clutter, discarding broken things, or arranging your space can make a subtle but powerful difference. This is the principle behind Feng Shui: the way your space is organized affects the flow of energy around you. By creating a peaceful, abundant environment, you support the vibration of the life you want to attract.

Change asks for courage. You might come to realize the need to stand up for yourself, release certain people, things, or habits that no longer serve you. Be brave enough to rethink your whole identity, because there is nothing in this world that you cannot do.

Watch content that lifts you up. Listen to music that energize you. Engage in conversations that inspire you. Keep surrounding yourself with things that align with the frequency of love, joy, and gratitude.

When you're aligned, the right people and opportunities start showing up. But abundance doesn't come

from thought alone. Alignment brings you halfway, taking action is what bridges the gap between thoughts and reality.

Humans aren't yet capable of turning thought into matter without the journey in between, even if such potential might one day be possible. For now, intention and action must work together. Without mining, we wouldn't have gold. There's an entire process behind obtaining it, from discovering the source, extracting the ore, refining it, and shaping it into its final form. In the same way, you plan, take action, and do the work to bring your goal into reality, while aligning yourself internally so you're ready to receive it. That is the science behind getting what you want.

Start now. Don't waste your energy worrying about the future, because it only makes your mind restless. Conditions don't have to be perfect for you to begin. Focus on what you can do today, and let go of regrets from yesterday and anxiety about tomorrow. Don't carry tomorrow's work into today; you'll always have the time you need to fulfill what's meant for you.

When your intentions are clear, the world responds and starts arranging things to support you. Doubts or confusion will appear now and then and that is completely normal. Acknowledge it, but don't let it weaken your confidence or blur your vision. Trust yourself, follow your intuition, welcome the opportunities that come your way, and take action to bring your goals to life.

Remember that energy is magnetic. When you're in a high state, toxic, negative people gradually exit your life. You naturally attract what matches your vibration, and the people who no longer align with your growth will drift away. This is part of the natural flow of life. The Law of Impermanence reminds us that nothing stays the same, and change is the constant. Don't cling, but watch these changes add new colors to your life. Trust that nothing is ever truly lost, because energy simply transforms.³⁸

The faster you can align, the easier it is to quantum leap. But there is no need to rush; life never have to be hurried. The meaning of life is just to be alive. Society has taught us to value constant doing and achieving, but that is simply not how we are built.

Life becomes beautiful when you start seeing the truth. When you have a moment, take a seat and observe the world you are creating. Know that everyone is a mirror of you. When your brain begins to label or judge, "That person's hair looks funny", "The kid at the back is noisy", simply watch your thoughts. Notice how your feelings changes when you switch your perspectives toward them, you'll find that everything is essentially neutral. You'll learn to flow with divine timing, trust that you always know when the moment

³⁸ Julius Robert Mayer, "Remarks on the Forces of Inorganic Nature," *Annalen der Chemie und Pharmacie* 121 (1842): 233–240.

has come. Manifest with love. The more you let go of control, the more you receive. Know that the universe has your back.

FEAR

Low frequency has long, slow wavelength
and activates very few DNA coding sites,

limited perception to reality = limited access to truth = limited consciousness

LOVE

High frequency has short, fast wavelength
and activates many more DNA coding sites

higher perception to reality = greater embodiment of truth = higher consciousness

The Music in You

Sound influences matter, including the cells and molecular structure in the human body. Since the brain is about 75% water, the vibrations from sound waves can affect its state.

"You make me sick"

"I love you"

Heavy Metal Music

"Cannot"

"I can do it"

Unresolved Emotions

If you are someone who have lived in fear or anger for a long time, it can feel as though that is who you are. Especially if you were hurt badly. Once you let go, it can almost feel like you're saying, "What happened to me did not matter."

Your pain is real, and your feelings matter.

Acknowledge what happened was a challenge the universe arranged for you. Letting go doesn't mean excusing what happened or forgetting it. It means choosing to see the bigger picture, that this experience was meant to teach you something or serve a greater purpose, so you can reclaim your power, protect yourself and make your wellbeing a priority.

You are allowed to feel angry, hurt, or disappointed. In fact, it is recommended for you to express these emotions as much as you need; otherwise, they can be trapped in the body and lead to imbalance of your solar plexus chakra, which is the center for personal power and self-confidence. However, holding on keeps you stuck in lower energetic states, which can weigh on your mind, body, and spirit. Many illnesses are linked to unexpressed emotions and chronic stress.³⁹ By releasing and balancing your energy, you can support your body's natural, incredible ability to heal itself.

³⁹ Claudia Elsig, "The Physical Consequences of Burying Emotions," *Journal of Body, Mind & Health* 12, no. 3 (2020): 45–58.

Write, talk, or let it out in a way that is safe. Express yourself fully without hurting anyone, including yourself. When you acknowledge an emotion, you give it space to dissolve. When you make it your whole identity, it takes over your life. The real freedom is feeling without being ruled by what you feel. Allow yourself to let the pain go gradually, step by step. You deserve a future that isn't chained to your past.

Protect Your Light

And one last thing, be mindful of what you consume from the media. When you scroll through social media or watch the news, notice what emotions they are feeding you.

You don't have to avoid the news or turn away from suffering. Watch, but from an observer's perspective, so it does not pull you down. Help people who are in need, but don't let their sorrow blind you to your own blessings. If you forget gratitude, other people's darkness can dim your light.

Even counselors need their own counselors to process feelings and maintain emotional balanced. If your light goes dim, you can't heal others, you can't uplift the space around you, and you can't provide.

Protecting your vibration comes first, that is why self-love is so important. Your light is what lifts every being around you. As you align with this new vibration, the transformation ripples outward, stabilizing and uplifting the

collective field of the planet, creating ripples of healing and balance for all life. You may not notice it, but your influence reaches farther than you can imagine.

You will soon see that life is constantly responding to your vibration, not a series of random events landing on you. Every thought you have is a pulse in the field, sending out waves that attract matching frequencies back to you. The calmer and clearer your frequency, the more harmony you experience. The more love you radiate, the more your world mirrors it back.

Tune into the frequencies of joy, abundance and love today. Start with gratitude. It is the fastest way up.

Truth V

Time is Relative

Time is something we all live inside but rarely question. And when you do question it, almost nothing holds up. Children often ask, “Who invented time?” because something about it feels instinctively strange to them. As adults, we grow accustomed to the ticking clock and calendar days, forgetting that time is, in many ways, a paradox. It is a mental framework we use to make sense of change, not an ultimate truth of existence.

“Time is an illusion. The only thing that’s real is the present moment.”

— Eckhart Tolle, *The Power of Now*

Rewriting the Past?

At the speed of light, time would stop. Scientific evidence shows that time behaves differently under varying speeds and gravitational forces.⁴⁰

If you took a spaceship near the speed of light for one year, when you return, maybe ten years have passed on Earth. To the person moving, everything feels normal. But to an outside observer, your clock slows down. This is called time dilation. Both perspectives are true, because each person's experience time based on their motion.

Time also slows down in stronger gravitational field. That is why clocks on satellites orbiting Earth, where gravity is weaker, run faster than clocks on the ground. GPS systems actually have to be corrected for them to stay accurate. Hence, it is not wrong to say that gravity literally bends time.

Space and time are not two separate things. According to Hermann Minkowski, Einstein's teacher, they form a 4th dimension called spacetime.⁴¹ It means the past, present, and future all exist at once within the same continuum, and we each move through them at our own pace.

⁴⁰ Albert Einstein, "On the Electrodynamics of Moving Bodies," *Annalen der Physik* 17 (1905): 891–921.

⁴¹ Hermann Minkowski, "Space and Time," in *The Principle of Relativity: A Collection of Original Memoirs on the Special and General Theory of Relativity*, ed. H. A. Lorentz, A. Einstein, H. Minkowski, and H. Weyl (New York: Dover, 1952), 75–91.

In Truth III, we talked about the double slit experiment that demonstrated how particles act differently as we observe it. But that was not the craziest part. In later studies called Quantum Eraser⁴², scientists used a crystal to split each photon into two entangled twins, one went straight to a detector, the other took a longer, delayed path through a set of mirrors and filters.

Here is where it gets strange: if the second photon's path information was kept, the first photon looked like a solid particle. But if that path information was erased, the first photon showed up as a wave—even though it had already been detected. It was as if the photon's past behaviour depended on a future decision. To this day, physicists are still debating what this means for our understanding of time, reality, and observation.

Many people interpret this as evidence for retrocausality—the idea that cause and effect aren't always linear. In this view, time doesn't simply move forward; sometimes, the future can shape the present. Whether light behaves as a wave or a particle appears to depend on what information exists, and whether that information is preserved or erased. Perhaps reality wasn't fixed until the information itself was decided, as a later measurement influenced what happened earlier, or “rewrote the past”

⁴² Yoon-Ho Kim, R. Yu, Sergei P. Kulik, Yanhua Shih, and Marlan O. Scully, “A Delayed-Choice Quantum Eraser,” *Physical Review Letters* 84, no. 1 (2000).

In 2012, scientists in Vienna tested this on a larger scale in what's known as the delayed-choice entanglement swapping experiment.⁴³ They showed that a measurement performed after two particles were detected could determine whether those earlier particles behaved as if they were entangled or independent. To some, this seemed to imply that the future already exists, and it's quietly influencing your present moment right now.

If we map this out, time becomes one continuous axis, changes in the future affects the present, and what you do now have the power to rewrite the past for the better.

So rather than this:

Past → Present → Future (fixed flow)

It's more like this:

Past $\rightleftharpoons$ Present $\rightleftharpoons$ Future (interactive, connected)

Yet the mainstream scientific view offers a contrasting interpretation. The delayed-choice quantum eraser doesn't show the future rewriting the past; instead, it reveals that quantum events are linked by correlations that

⁴³ Xiao-song Ma, Stefan Zotter, Johannes Kofler, Rupert Ursin, Thomas Jennewein, Časlav Brukner, and Anton Zeilinger, "Experimental Delayed-Choice Entanglement Swapping," *Nature Physics* 8, no. 6 (2012).

defy our everyday sense of cause and effect. What happens isn't determined by the order of measurements, but by how the results connect and gain meaning when viewed as a whole. In this sense, the particles' behaviours aren't changed after the fact; rather, their outcomes are correlated parts of a single quantum system, where the past isn't fully determined until all measurements are complete.

Whether you see it as evidence of retrocausality, as particles lacking definite states until they're jointly measured, or as a deep kind of nonlocal correlation that connects events across space and time, it all depends on interpretation. Nonetheless, all views describe the same mysterious, non-classical truth about how reality unfolds.

The Fibonacci Spiral is identified with the divine proportion due to its frequent appearance in nature and art. It is the expression of the Golden Ratio ($\Phi \approx 1.618$).

Ancient cultures like the Mayans and Hindus also described time as spiral. You continually come back to things you thought you understood and see deeper truths.

The Prison of Time

Eckhart Tolle, in his book *The Power of Now*, described two kinds of time: Clock Time and Psychological Time.

Psychological time is the kind of time that lives only in the mind, the constant pulling into the past (regret, memory, identity) and projecting into the future (worry, hopes, plans, fear). It's where anxiety, regret, resentment, and endless wanting exist.

You might find yourself thinking, "I always mess things up," or "Once I get there, I'll finally be happy." That's psychological time. It's built from memories and imagination, and pulls you away from what's actually happening now.

Most people are "thinking about life" instead of living it, and we suffer because we take our thoughts for reality. A 2020 Penn State study found that 91% of our worries never come true, and even among the small portion that did, most were handled better than expected.⁴⁴ This highlights how the mind often overestimates threat and underestimates its own ability to cope, showing that nearly all the things we fear exist only in thought.

⁴⁴ Kristoffer LaFreniere and Michelle G. Newman, "Exposing Worry's Deceit: Understanding Worry's Effects on Emotional Responding," *Behavior Therapy* 47, no. 4 (2016): 563–576.

"A person who thinks all the time has nothing to think about except thoughts. So he loses touch with reality and lives in a world of illusion."

ALAN WATTS
MUSIC AND LIFE

The past gives you identity, and the future offers the illusion of salvation; but both are mental constructs. Nothing ever happens in the past, it happened in the now when it was unfolding. Nothing ever happens in the future, it will happen in the now when it comes. Life is never not now.

Most human suffering comes from being trapped in our minds, constantly replaying the past or worrying about the future. It can even be said that the brain is a time machine, always traveling everywhere except the moment now. And because of that, many people don't realize how disconnected they are from the aliveness of the present moment.

When we are collectively trapped in psychological time, chasing some future “heaven,” we often create a kind of “hell” in the present. Wars have been fought in the name of a promised paradise or a better future, yet they bring only suffering in the now. On a smaller scale, many of us do the same by sacrificing today's peace for tomorrow's imagined happiness.

The more we identify with thoughts, emotions, and stories about who we are, the more we live in a kind of dream: unconscious and never at peace. There are two different depths of unconsciousness as described by Eckhart Toelle: ordinary unconsciousness and deep unconsciousness. Ordinary unconsciousness is what most people live in daily, a subtle but ongoing sense of unease, boredom, or restlessness. It is the background noise of discontent that

keeps you fidgeting and chasing the next thing. Deep unconsciousness is more intense, showing up as pain, anger, or despair that takes over when we lose all awareness of the present moment. This is the only state where acts of cruelty or violence become possible, because the person is fully identified with the mind's pain and no longer conscious of being.

The egoic mind thrives on time; it needs the past to maintain its story and the future to sustain its hope. It tells you peace will come later, after you achieve something or become someone better. But in doing so, it blinds you to the peace that already exists here and now.

The way out isn't to fix the past or control the future, but to become aware. When you bring awareness to your thoughts and emotions instead of reacting, they dissolve. Awareness itself is the healing. Just as you witness the duality of the world, witness your thoughts without judgement, and you create space for presence. In presence, you reconnect with the Source—the deeper dimension of who you really are, beyond form or identity.

The Living Rhythm of Time

Clock time, unlike psychological time, is practical. It helps us grow, evolve and act meaningfully in the physical

world. It allows the collective rhythm of life to function, to meet, plan, organize. Used consciously, clock time serves us.

The problem arises when clock time seeps into our inner world, and every moment becomes measured, rushed, or compared. The clock, once a tool, starts to rule. Even when there is no real urgency, the mind keeps counting, "I'm running out of time. I should be further ahead. I must catch up". We then slip into psychological time.

The difference from psychological time is subtle, but profound. In clock time, we remember, but not dwell; we learn, but not in regret or self-blame. We can plan for the future without being consumed by worry or the need to control it. Each lesson from the past becomes relevant and alive only when applied now. Presence is not forgetting time, but moving through it mindfully.

Long before the adoption of the modern Gregorian calendar, human societies measured time closer to nature's pulses. Ancient calendars were built on cycles: lunar phases, seasonal changes, or migration of stars.⁴⁵ For example, the Islamic calendar is a lunar calendar where each month begins with the sighting of the new moon. The Hebrew, Chinese, and Hindu calendars, on the other hand, are a lunisolar system where months follow the new moon, and

⁴⁵ E. G. Richards, *Mapping Time: The Calendar and Its History* (Oxford: Oxford University Press, 1999), 3–25.

years are adjusted with a leap month to stay in sync with the solar year.

Time was not just a number as it is today; it was a living cycle, felt in the body and in the land. Morning light, animal migrations and human fertility all flowed in rhythm with the calendar. You could sense when the moon shifts, the seasons changes, and the life-force is rising or resting. Women's natural monthly cycle, roughly 28 days in many cases, was aligned with lunar months. When you live by those cycles, your time becomes intuitive. You feel grounded and alive.

While we shouldn't overstate a fixed rule across all cultures and individuals, the alignment of human biological rhythms with lunar and seasonal cycles is widely observed in anthropological studies. These calendar allowed us to stand in sync with the Earth, understanding deeply about cycles of growth and rest.

Then came the Gregorian calendar, introduced in 1582 by Pope Gregory XIII, reforming the older Julian solar calendar. It was more mathematically precise way to align the calendar year with the Earth's orbit around the Sun, ensuring that the date of Easter remained consistent with the spring equinox.

The solar cycle is fixed at roughly 365.242 days, which doesn't align neatly with the moon's phases or natural rhythms. To make it work, humans adopted an artificial

correction system by dividing it into equal months and adding leap years. Every year now had the same number of months, weeks, and workdays, with no regard for seasonal alignment.

In doing so, time became a mechanical system. Where natural rhythm is fluid and circular; the Gregorian calendar is linear, segmented and fixed. It counts hours and minutes instead of sunrise and sunset, weeks instead of moon phases, fiscal quarters instead of harvest seasons, turning life into a timeline.

The Gregorian calendar is predictable and easier to standardize, perfect for agriculture, governance, religion, and later, capitalism and industry. Once you have a precise, universal standard of time and days, society can run on deadlines and productivity. But the trade-off was that people became disconnected from cyclical, embodied awareness.

That was the first way we grew distant from the natural rhythm of life. As you become aware of psychological time, clock time versus the living time of nature, you realize that our sense of time is truly shaped by our mind.

“Eternity is not future or past. Eternity is a dimension of now. It is a dimension of the human spirit—which is eternal.”

JOSEPH CAMPBELL

The Eternal Now

You start to wake up the moment you understand that identifying with the mind's constant stream of thoughts is what drifts people into unconsciousness. You now see that you are not your thoughts or emotions, but the awareness behind them. From there, presence arises on its own. You stop fighting the mind and simply allow it to move without being pulled in.

The mind is a powerful tool. Used with awareness, it works for you; when it takes over, dysfunction begins. The mind's nature is to move, to think, to pulse; like waves on the surface of the ocean. Thoughts rise and fall; but when you stop identifying with every wave, you realize the vast stillness beneath it. That stillness is awareness itself. Zen is the practice of resting in that awareness, to let the mind be as it is without attachment or judgment, to become Saksin, the one who simply sees.

Truth can't be found by thinking about it. The moment you try to grasp it, you stay in the realm of the mind. But when you see it, awareness shifts from thought to being, and life suddenly changes. Time, ego, and suffering all lose their grip in that presence.

You are not lost in your head anymore. You are here, fully awake in the present moment. It can feel like you are high: colours become sharper, sounds richer, even the air feels alive. You can sense the space between things, the quiet

hum of existence itself. For the first time, you're not thinking about life but immersed in it. The mind quiets, yet awareness and energy expands. You soon realize that this state of clarity and aliveness has always been here. You were just too lost in thought to notice.

You've likely experienced this state before in moments of deep focus, what psychologists call *flow*. It is when you lose yourself in something so completely that time disappears. It can happen when you run, sing, dance, write or work. Those moments feel so free because you have step out of the mind. The same happens in times of danger where you need to become fully alert, hyperaware and present to act for survival. Some people chase extreme sports like motor or car racing for this, risking their lives just to feel this rush of aliveness. But the truth is, you don't need movement or intensity to find it. Presence is always here. Through stillness, meditation, and mindfulness, you can enter the same state of awareness anytime, anywhere.

"When every cell of your body is so present that it feels
vibrant with life, and when you can feel that life every
moment as the joy of being, then it can be said that you are
free of time."

ECKHART TOELLE
THE POWER OF NOW

It is true that you can feel high without using drugs or alcohol. You never needed anything outside of yourself to feel good. What you have been chasing through substances, people, or experiences was never about that thing itself, it was about escaping the noise in your mind; a solution to distract you from an emptiness you can't quite name. The void that reflects a deep discomfort with one own self, the desire to feel a part of something instead of feeling apart.

Addicts are, in truth, the most awake to the suffering of existence. Somewhere within them remember a great stillness, a feeling of unity from before birth or beyond time, and the soul longs to return to it. Substances offer a brief moment of forgetting oneself and the separation, a temporary doorway to that feeling of divinity. When sober, they feel the divine absence so intensely that they will do anything to feel whole again.

Addiction, then, can be seen as a misunderstood calling that too often ends in tragedy. The separation they feel is only an illusion, but not knowing this, they reach for the substance and mistake its fleeting comfort for relief. And with every attempt, they sink deeper into that false refuge, thinking the next high might finally be enough. Yet what they are chasing cannot be found there.

The true high, the one no substance can match, comes from being fully present. When your clarity becomes so sharp that the illusion collapses and wholeness resurfaces, you finally find the comfort and bliss in being. In this state,

you realize that all the answers you are searching for has always been within. There is no suffering in the eternal now; joy, fulfilment and love overflows from within. All you have to do is to be still.

Battling addiction takes time because the brain has formed strong association with the object of desire. That connection is wired deeply through repetition and reward, as that addiction soothes an inner wound and brings momentary relief from emptiness.

Just as the brain can learn this association, it can also unlearn it. When you begin to find peace in stillness instead of stimulation, your brain starts to associate calm with presence, rather than escape.

As your consciousness expands, you may be surprised to find that your body starts to reject consumption of any harmful substances by producing negative reactions such as nausea and aches. Accept the intelligence of your body and honour it by treating it as your sacred vessel, caring for it with nourishment, movement, and rest it needs to heal.

You may find it challenging to maintain presence in the early stages, especially when you are out among people, as the flood of sensory inputs surrounding you triggers habitual responses from your body and many of your actions happen unconsciously. With continual practice, the more you return to this state, the longer it will last. In time, it will become your natural state, and you will be in a constant high.

"The Master said, "When you are with others, be wholeheartedly present; do not let your mind wander. In doing so, all things flourish around you."

CONFUCIUS

Divine Timing

In the previous chapter, we talked about quantum leaping. When something you desire hasn't appeared yet, it's easy to assume it's delayed or not meant for you. But it's simply waiting for you to match its frequency. The key is alignment, not chasing. That's why understanding vibrations comes before understanding time.

We are all given the same 24 hours, but we don't live in the same state of consciousness. Some people move through time differently, carrying a certain lightness and clarity; they seemed less bothered by hurdles or mistakes, and everything just flow for them. To the outside eye, it may look like they are lucky, naïve, or that life has been kind to them. But in truth, they are simply living in resonance.

The more you grow, the more familiar abundance is to you. You start feeling worthy and at ease with larger sum of money. Small wins come easily because your energy already knows their shape. Bigger dreams take longer as they require a larger version of you to hold them. When you embody the version of yourself who already has what you desire, it naturally find its way to you, and it will always be on time.

But here's what I'll tell you as a friend: don't stress yourself. Even if you take it slowly at your own pace, everything meant for you will still arrive right when it's supposed to. Relax, but do not be lazy. Do your best, but do

not take things too seriously. Enjoy the journey, and don't miss the beauty along the way while moving towards your destination.

Just like the ancient calendars that followed the cycles of the moon and the rhythm of the seasons, life itself moves in patterns of rise and rest. There is a time for action, for building and creating; there's also a time for stillness, for reflection, healing, and planning. Nature never rushes its process. The farmer doesn't harvest in winter, the trees don't bloom before spring. When you align yourself with these natural cycles, you will see that there is no point forcing or controlling how things unfold, and you begin to flow with the energy that supports the entire universe.

Understanding the nature of time and vibration allows you to grasp the true meaning of divine timing. Everyone moves through their own timeline, your life unfolds exactly when conditions align. Some people find love as early as high school and marry young, while others achieve their dreams much later in life, even after retirement.

When something you desire feels out of reach, don't rush it. Be patient. Do the work, and trust in divine timing. Life is preparing you. The experiences you're going through are necessary to shape you into the person who's ready to receive and hold what you've asked for. You think you "should have" found your purpose by now, achieved success, or met the right person years ago. But when it finally

happens, you will see the perfection in the timing. The years in between were never wasted, they were sculpting you.

Looking back, you will realize every hurdle or delay guides you closer to the right path. The same goes for anything you have wanted so badly but couldn't have; life is not against you, it's just that something better is still on its way. The universe has a way of protecting you from what isn't aligned, even when you can't see it at the time.

That is how magical life is. When you understand the laws that govern this reality, you start flowing. And everything begins to unfold in the most natural, miraculous way.

Truth VI

Destiny, Karma, & Free Will

You ever wonder if life is written for you, or you are writing it? Many people believe that life is destined, it seems as though we have little control of the people and events that present themselves before us. Sometimes it really does feel like we have little control over who shows up or what happens. Some people feel deeply familiar, some appear at the strangest times as if fate is nudging things along. And then there are the karmic lessons we can't seem to avoid. So how much free will do we actually have?

The Part Already Written

In 2008, neuroscientist Soon Chun Siong and his team at the Max Planck Institute in Germany ran an interesting experiment. Using fMRI brain scans, they asked people to press a button whenever they felt like it. Surprisingly, the researchers found that they could predict the person's choice up to 7 seconds before they became aware of deciding.⁴⁶ 7 whole seconds.

It strengthens the famous experiment ran by neuroscientist Benjamin Libet back in the 1980s, which shows that your brain “decides” first, and your conscious mind becomes aware after.⁴⁷ It raised a question that many still debate until today: is destiny already written in the wiring of our brain?

Many ancient wisdom speak of the same idea. In Chinese metaphysics, the Ba Zi (Four Pillars of Destiny) reads your birth year, month, day, and hour as a kind of energetic blueprint. It can reveal the general path of your life, your strengths, challenges, and even down to the details of the theme that shape each year you live. Numerology, originated in ancient Egypt, calculates your life path, life cycles, personality traits and lessons your soul came here to

⁴⁶ Chun Siong Soon, Marcel Brass, Hans-Jochem Heinze, and John-Dylan Haynes, “Unconscious Determinants of Free Decisions in the Human Brain,” *Nature Neuroscience* 11, no. 5 (2008): 543.

⁴⁷ Benjamin Libet, “Do We Have Free Will?” *Journal of Consciousness Studies* 6, no. 8–9 (1999): 49.

master. Similarly, in Vedic astrology, the alignment of planets and constellations at your birth outlines patterns and tendencies carried by you into this lifetime.

Some people find comfort and clarity in this knowledge, while others find it confronting or daunting. The idea that your life has a fixed path can feel limiting, and scepticism is fair. None of these readings predicts every detail. However, ancient techniques are wisdom passed down over generations, drawn from centuries of observing the rhythms and patterns of human life. You can choose not to know, and that is, essentially the beauty of having a human experience. As multidimensional beings, we came into this third dimension where the future is concealed, so we can experience the excitement of watching our path unfold in real time.

The wise ones, nevertheless, use these as mirrors. What's important to know is that the sketch is not the full painting. We bring with us certain traits, like luggage packed for a journey, to learn, evolve, and ultimately find our way back to the Source. Self-understanding is the starting point. From there, you can see what needs healing and work.

"The curious paradox is that when I accept myself just as I am, then I can change."

CARL ROGERS

Looking Karma in the Mirror

In Sanskrit, karma means "act" or "action". Contrary to common belief that karma is about punishment or reward, Hindu and Buddhist teachings explain it as natural imprint of every action, like grooves in your mind and body that form the blueprint of your future experience.

Sadhguru explained karma as “layers of memory in your body and your cells.” The way you walk, talk, even your fears, much of it is unconscious karma shaping you. That is why you keep repeating the same habits, same emotions, same reactions. You are not cursed, you’re just replaying memory.

In epigenetics, trauma and experiences have been found to alter gene expression, and these changes can be passed down. Children of Holocaust survivors carry traces of the trauma their parents lived through, not in memories, but in their biology. Studies by Dr. Rachel Yehuda and her team at Mount Sinai showed that the children of survivors share the same changes in stress-related genes (FKBP5) as their parents.⁴⁸ It’s as if the body remembers what the mind never experienced.

When someone goes through deep trauma, their body adapts as stress hormones shift and fear responses heighten. These changes can leave marks on the genes

⁴⁸ Rachel Yehuda et al., “Holocaust Exposure Induced Intergenerational Effects on FKBP5 Methylation,” *Biological Psychiatry* 80, no. 5 (2016): 372.

themselves. Those marks don't alter DNA, but they influence how certain genes are expressed, and those patterns can be passed down.

Karma lives in the body as much as it lives in the soul. Inherited pain is real and scientific. These emotional imprints live on silently from one generation to the next, until someone finally becomes aware enough to break the cycle, and heal.

Every reaction, every thought builds a kind of energetic rhythm in you. The more you repeat it, the stronger it gets. Over time, it becomes the automatic way you respond to life.

Awareness is what breaks the loop. When you catch the pattern, you create a moment of choice. From there, you can choose a different response and gradually build a new way of being.

The Part You Write

The moment you become conscious of your own patterns, a new path becomes available. That is how you shift karma and break out of the programming of your character, by responding from presence.

Every Chinese New Year, people look forward to the annual forecasts for the 12 Zodiac signs, where they are ranked by overall luck of the year and areas like prosperity,

health, and relationships. When a sign is said to face the energy of accidents or blood-related misfortunes, people are advised to release that energy consciously by doing something symbolic and harmless, such as donating blood, going for a dental scaling, or having a beauty procedure. The idea is to be aware of the energetic climate of the year and take controlled action to redirect the energy instead of worrying or resisting it.

The same applies to your inner world. When you face old patterns with awareness instead of fear, you're not fighting the energy but guiding it into harmony.

This is where free will enters. You don't control the family you were born into, or the body you inherited. But right now, you can choose to live differently.

Neuroscience calls this neuroplasticity, the brain's ability to rewire itself through practice and new choices. Every time you act against your old pattern, you weaken that connection and build a new one.

Philosopher William James, the father of modern psychology, once said, "My first act of free will shall be to believe in free will." In other words, your choice to believe you can choose is itself the door to change.

You don't control every card life deals you, but you absolutely choose how you play them. In numerology, each life paths have positive and negative attributes, and how you turn out depends on how much you've worked on your personal development. The same goes for any kind of

reading—Tarot, palm, astrology. What is being read is your current energy: the energy you are born with, the energy you are carrying now. If you really want things to change, you must first shift that energy. It requires that you rewire your brain, your thoughts, emotions, actions; focus on calling yourself out and turning those weaknesses into growth.

It's not easy, that is why most people did not escape their patterns. When it's wired into your biology, playing out these patterns puts you in your comfort zone, you will feel like you are doing the right thing. An unconscious mind leads to the illusion of "I am always right". Paired with arrogance, some even find the need to correct anyone else who does not conform to their values. But that is simply the trap that you came here to overcome.

This arrogance cannot co-exist with wisdom. The wiser someone becomes, the more they realize how much more there is to learn. They stay open, curious, and willing to listen; not stubborn or defensive. Stubbornness and defensiveness are what kill relationships, because when you're always trying to be right, you stop listening. Without listening, there is no understanding, and without understanding, there is no real connection. Defensiveness makes you point the blame outward instead of looking inward, not realizing the key to change is always within yourself, and hence not taking accountability for your words and actions. This often leads to more hurtful things being

said or done. The karmic cycles repeat, and life becomes suffering this way.

Keep in mind that karma binds you only when you live unconsciously. The moment you act with awareness, you stop feeding the old programming and start writing a new one. Your future is simply the karma you're creating today. It is being written now, through every choice you make. That's how you rewrites destiny with free will.

Like the Chinese saying goes: Fate is one-third, luck is one-third, and effort is one-third.

Remember we talked about retrocausality in Truth V: the idea that the future can influence the past. When you make a new choice today, you don't just shift your future, but change how your past exists in your memory and energy. You reassign meaning and release the old charge. In doing so, you alter the chain of cause and effect itself.

That, essentially, is how healing works: by rewriting your relationship with what once was, you open the path to what can be. Every conscious act moves you into alignment with a new version of yourself, one carrying different memories and different possibilities.

"He who knows others is wise;
he who knows himself is enlightened."

LAO TZU

Truth VII

Layers of Being

As multidimensional beings, our minds are not limited by this 3D world. That explains why some of us experience psychic abilities, astral travel, telepathy, and visions.

Science talks about dimensions beyond the 3D; spirituality talks about layers of bodies. I'll connect them for you.

I am guessing you've heard of the seven chakras (energy centers)—Root, Sacral, Solar Plexus, Heart, Throat, Third Eye, Crown. Osho spoke of something deeper—the seven bodies, seven layers of being that unfolds as we grow.⁴⁹ Each chakra is connected in a special way with its

⁴⁹ Osho, *The Seven Vital Energy Centers* (Taipei: Life Potential Publishing Co., Ltd, 2004).

corresponding body. Each body has its own plane of experience, and within each lies a natural polarity, a duality that must be transformed, not suppressed. As we fully develop one, we naturally step into the next. This is the path to enlightenment.

Human Energy Field

The Physical Body — from birth to about 7 years is when the physical body grows. This body is linked to the Root chakra, a stage of grounding into matter and learning the language of the body as we learn to walk, eat, sense, and

survive. The duality of the physical body is *sex vs celibacy*. Sex is the natural energy of life; through understanding and awareness, it transforms into creativity and spiritual vitality. Suppression only leads to tension. When we become conscious of our desires instead of being ruled by them, transformation happens naturally. This awareness is the first step in awakening the other subtler bodies that still lie dormant, the first mastery over matter. If growth stops here, a person becomes trapped in materialism, living only for food, sex, comfort, possessions.

The Etheric Body — develops roughly between ages 7 to 14. This body corresponds to the Sacral chakra, located just below the naval. Here, emotions, instincts and survival energies mature. Living through this body means feeling deeply. Its duality is *fear, anger, and hate vs love, compassion, and fearlessness*. To fight or suppress emotions is to remain bound to them. But when we see fear without escape, it turns into courage; when anger is understood, it turns into forgiveness; when violence is understood, it turns into compassion. Each dark emotion hides its light opposite. If growth halts here, life becomes ruled by feelings — fear, violence, drama, jealousy, and moods dominate reason.

The Astral Body — matures around ages 14 to 21, the time of questioning, rebellion, and intellect. This is the layer where thinking, ideas, reasoning, conceptualizing become the dominant mode of experience. We question, analyze, compare, and form opinions, building world-views. It is the

“mind at work” stage. Its duality is *doubt and endless thought vs trust and clarity*. Doubt is natural, but repression of doubt breeds blind belief, which leads to ignorance. True trust is the outcome when doubt has exhausted itself. By inquiring deeply into doubt itself, trust arises. When thought becomes clear and calm, the seeker steps out of confusion into knowing. This transformation marks the awakening of Solar Plexus chakra, where inner clarity, confidence, and the power of choice expand. If stuck here, a person may live entirely in the head: logical but cold, clever but disconnected from heart and intuition.

The Mental Body (Psyche) — develops roughly between ages 21 to 28, when imagination and creativity blossom. This is the bridge between the lower mind and the higher spirit, the realm where psychic sensitivity opens. Intuition awakens, synchronicities and inner guidance becomes louder. Its duality is *imagination and illusion vs vision and insight*. In the unawakened state, this body lives in fantasy of dreams, hopes, fears, and mental stories. But when awareness enters, imagination turns into insight and the capacity to see truth beyond appearances. The Heart chakra opens when one can perceive without the senses, seeing with the heart, not the eyes.

The Causal or Spiritual Body — from around 28 to 35 years onward. When awareness becomes continuous, we step into the spiritual body. Here, duality ends. The Throat chakra governs this body, one who enters it no longer acts

unconsciously. This is the realm of the “awakened one.” The spiritual body is the realization of “Who am I?”, it marks the end of search for self-identity. It is the first true taste of freedom, no longer bound by emotion or thought. Bliss arises here, but even bliss can become an obstacle if we cling to it. The seeker must remain a witness even to bliss, for the journey continues beyond the self. Here the ego (“I”) dissolves, but the subtle “am-ness” remains. You begin to experience yourself not as a person, but as presence itself.

The Cosmic Body — from around 35 to 42 years. Awareness expands into unity. Telepathy, astral travel, visions beyond space and time can arise naturally. You start to experience yourself not as one person, but as part of the great web of existence. Everything appears connected and alive. This corresponds to the Third Eye chakra. Here, one realizes “I am the Whole”. The sense of separate self dissolves into universal existence. Awareness expands infinitely, yet a subtle presence remains. You experience pure existence without identity. Many seekers stop here, believing this is the ultimate. But beyond even this vast consciousness lies one more door: the doorway into nothingness.

The Nirvanic Body — beyond 42 years. This is the last body beyond birth and death, beyond experience. Beyond the cosmic is the non-cosmic: pure nothingness. Pure consciousness awakens, boundaries dissolve, the self merges with the infinite. Some traditions describe this as merging with God, the Source, or infinite consciousness. No

experience remains, because the experiencer too is gone. The journey itself ends because there is no one left to travel. This is nirvana, the completion of all seven bodies, where light and darkness, life and death, are seen as one. This is liberation—enlightenment.

It's important to remember that ascension is not something to be rushed. The journey must begin with the first body and proceed step by step. If you're still rooted in the physical body but try to work on your mental or astral body, it can create conflict inside. Each body must be transformed in sequence so the next becomes available, otherwise the path becomes unstable.

For the first to the fifth body, structured practice and inner work are essential. But effort has its limit. Once you move past the fifth body, the whole approach changes. It becomes less about doing but more about being. Many people stop here, mistaking the fifth body as the end because there's no clear technique beyond it. That's why traditions often speak about five bodies but say far less about seven bodies. But it's not the end at all; it marks the beginning of the shift from self to non-self.

When it all makes sense

Physics tells us we live in three-dimensional world – length, width, and height; plus time, together, they form what’s known as four-dimensional spacetime. But some scientific theories, like string theory and M-theory, suggest that the universe may hold many more dimensions, hidden and compact, beyond what our senses can perceive.

Spiritual traditions use the term 'dimensions' differently. When people say “5D consciousness,” they don’t mean adding another axis, they're describing a higher state of awareness.⁵⁰

Map of Consciousness

Name of Level	Energetic Log	Predominant Emotion State	View of Life	God-view	Experience	Dimension
Enlightenment	700-1000	Ineffable	Is	Self	Synchronicity	Up to 12 th Dimension
Presence	600	Bliss	Perfect	All-being	8	5 th Dimension
Joy	540	Serenity	Complete	One	Extraordinary Outcomes	
Love	500	Reverence	Benign	Loving		
Reason	400	Understanding	Meaningful	Wise		
Acceptance	350	Forgiveness	Harmonious	Merciful	Happiness & Productivity	4 th Dimension
Willingness	310	Optimism	Hopeful	Inspiring		
Neutrality	250	Trust	Satisfactory	Enabling		
Courage	200	Affirmation	Feasible	Permitting		
Pride	175	Scorn	Demanding	Indifferent		
Anger	150	Hate	Antagonistic	Vengeful	Hyper-activity	
Desire	125	Craving	Disappointing	Denying		3 rd Dimension
Fear	100	Anxiety	Frightening	Punitive		
Grief	75	Regret	Tragic	Disdainful		
Apathy	50	Despair	Hopeless	Condemning	Inaction	
Guilt	30	Blame	Evil	Vindictive		
Shame	20	Humiliation	Miserable	Despising		

⁵⁰ David R. Hawkins, *The Map of Consciousness Explained* (Sedona, AZ: Veritas Publishing, 2013), 63.

Remember, as we talked about in Truth I, duality exists everywhere, our layers of being included. The key to rising above is neither to cling nor to resist either side of polarity. Only when you embrace both sides of the spectrum do you transcend it, and rise into the next dimension of being.

Modern science is slowly turning its attention to what once dismissed as mysticism: phenomena like intuition, near-death experiences, and altered states of consciousness, without realizing they have stepped into the study of the fourth body. Research on psychics, out-of-body experiences, and telepathic intuition may still be controversial, but they hint that the mind extends beyond what can be measured through neurons alone. As Osho once said in his 1970s discourse, that science will eventually agree with what spirituality has known for thousands of years. But beyond the fourth body, things shift from something you can measure to something you can only experience. Machines can't pick up enlightenment, nor can instruments detect awareness; at least for now. Even our physical senses are limited: we can only see light between 430–790 THz and hear sounds from 20 Hz to 20 kHz.^{51 52} These ranges are just a tiny fraction of the full spectrum of light and sound; much of what exists is entirely invisible and inaudible to us.

⁵¹ Eugene Hecht, *Optics*, 4th ed. (San Francisco: Pearson Education, 2002).

⁵² Brian C. J. Moore, *An Introduction to the Psychology of Hearing*, 6th ed. (Leiden: Brill, 2012).

So think of it this way:

Science speculates the universe is multi-dimensional.

Spirituality says you are multi-layered.

And in between those two truths, countless people throughout history have reported experiences of psychic flashes, astral travel, fulfilled prophecies, and glimpses of a world far greater than we've been taught to believe. When you see every individual as separated and disconnected, you tend to dismiss these shared human experiences that don't fit within your personal beliefs or values. Now that you understand the deeper reality, nothing in life truly surprises you anymore. Miracles start to make sense. They have always been part of the equation, merely hidden behind the limits of our perception.

Plasma, frequency, and energy are the threads connecting both perspectives, showing us that reality is dynamic and responsive. To access the vast unseen, we must develop both hemispheres of the brain, balancing logic and analysis with intuition and creativity. By elevating our consciousness, we open ourselves to a more complete perception of reality and a remembrance of who we are.

The Death of Fear

No spiritual tradition teaches that death is the end, because it isn't. It is simply the end of this illusion, this temporary playtime we call life. What we call "death" is really just a shift in dimension. Existence continues. The form changes.

Spiritual beings move through layers of existence, from the non-physical to the material and back again. You were never just this character or identity you associate with in this lifetime. This body is the vessel your consciousness experiences this dimension through.

It is like tuning a radio. When you change the frequency, you don't destroy the previous station, you just stop hearing it. The energy still exists, only vibrating at a different wavelength.

In the same way, when someone dies, their consciousness doesn't vanish but transition to a frequency our senses can't detect. We are multidimensional beings, capable of moving through realms of energy and form. This physical world is just one layer, one of the densest expressions of consciousness.

When spirit condenses, it realizes into matter. When it expands again, it returns to pure energy back to Source, or whichever name you give the infinite field of consciousness.

So many see death as an ending. In truth, it is a return, a coming home to the very energy that once gave you life. Nothing is lost, only transformed.

Knowing this, are you still afraid of death?

I know there might still be fear lingering, the fear of the unknown. But as you journey through these 7 Universal Truths, you now remember who you are. You remember your power as the creator. When you're no longer afraid of the worst-case scenario — death, you'll realize there's really nothing left in this world to fear.

You are an infinite being whose full abilities have been concealed by burdens, distractions, and self-limiting beliefs. But don't worry, that's why you are here: to experience, to shed, to awaken.

Every tradition, in its own language, has always pointed to the same truth: Hinduism calls it Moksha—liberation through self-realization and recognition of the true self as one with the ultimate reality. Christianity calls it union with God through love and surrender. Islam speaks of Ma'rifah and the journey toward Al-Insān al-Kāmil, the awakening to divine truth and the realization of one's fullest spiritual potential. Buddhism calls it Buddha-nature—the seed of awakening in every being. Psychology calls it self-actualization—the unfolding of our highest potential.

Different words, different paths, one single message: Enlightenment isn't reserved for saints or mystics. It is your birthright.

"Let go of the past, let go of the future, let go of the present,
and cross over to the farther shore of existence. With mind
wholly liberated, you shall come no more to birth and
death."

DHAMMAPADA

Afterword

What a strange yet beautiful world we live in. Some chase immortality, some wish to end their lives. Still, at the core of every desire lies the same longing, for lasting happiness, health, and love.

You are not here on Earth to live a miserable life. I hope you see that you never needed to convince anyone to love or understand you, nor are you in compete with anyone in this world. Just be who you are. Life becomes effortless when you're aligned with your true self. Only when you are going against your heart does everything starts to feel wrong, and you find yourself struggling, because darling you have lost touch with your inner truth. It was never meant to be that hard.

This whole world is created for you, and everyone else is merely a reflection of you. This book that you are reading is also your reflection, a part of you already knows.

When you close this book, I invite you to sit quietly for as long as you wish. Gently close your eyes and feel your heart. Imagine its energy expands, as slowly or quickly as you desire, filling the room, your city, and the entire Earth. From the perspective of an observer, see the planet glowing with your energy of love. When you're ready, open your eyes and look around. With full presence, notice how alive everything is. See, without discrimination, this beautiful, simulated world that you are creating.

We've come a full round. Whether you choose to live this life as an ordinary person or awaken to your fullest potential and divine consciousness, know that your life holds great meaning in the grand design of existence. Every experience, no matter how small or trivial, contributes to the evolution of the collective.

Forget trying to achieve, and focus on being present. In that presence, you will naturally step into the higher consciousness. Trust divine timing, even the hardest moments will pass. Align yourself with the higher frequencies, and you will begin to move in harmony with the rhythm of the universe

May this knowledge give you courage to break free from all that no longer serves you, even if means leaving your old identity behind. May it give you the clarity to see

past the illusion of duality and time, and help you find balance between intuition and logic. May it help you navigate life's challenges with greater ease, reminding you of the power that has always lived within you. May it guide you towards divine bliss and love, in every waking moment of your life and beyond.

With love and light,

Lara Y.

The New World is yours

With this new awareness, you may still catch yourself slipping into old ways. That is completely normal. Years of repetition wired those reactions in.

Give yourself grace when it happens. Every time you choose consciously, your brain learns it a little better. With consistent practice, it settles in quietly, and one day, you will just find yourself already living it.

When you are ready for a deeper, lasting change, talk to me. The Realign works directly with your subconscious, where we dissolve the patterns at the root, so your mind and body can finally move as one.
